# DIY Web App

- I went ahead with one of my options on my proposal which was to create a weather

  application using PWA and glitch, the success looks great and hoping that whatever

  cities you can select from allows you to show up to date weather from the dark sky's

  API, there is also all the source code on my GitHub that will show my changes and final

  code. The weather app itself shows the weather, the day and month following with year

  and current time. Also vie added a weekly forecast review and other elements like

  humidity and wind with sunrise and sunset. Below I will show you my demo of what my
  web app looks like.

1. The homepage unconfigured

2. The prompt to add the cities

3. The page when two cities are added

To view the app, please visit the GitHub page.

Thank you,
Taranpreet Singh
